## **Summary of Alerts**

Risk Level	Number of Alerts
High	0
Medium	3
Low	3
Informational	5
False Positives:	0

## **Alerts**

Name	Risk Level	Number of Instances
Absence of Anti-CSRF Tokens	Medium	4
Content Security Policy (CSP) Header Not Set	Medium	51
Missing Anti-clickjacking Header	Medium	44
Server Leaks Information via "X-Powered-By" HTTP Response Header Field(s)	Low	71
Server Leaks Version Information via "Server" HTTP Response Header Field	Low	84
X-Content-Type-Options Header Missing	Low	75
Authentication Request Identified	Informational	1
<u>Charset Mismatch (Header Versus Meta Content-Type Charset)</u>	Informational	30
Information Disclosure - Suspicious Comments	Informational	1
Modern Web Application	Informational	9
<u>User Controllable HTML Element Attribute</u> ( <u>Potential XSS</u> )	Informational	4

## **Alert Detail**

Medium	Absence of Anti-CSRF Tokens
	No Anti-CSRF tokens were found in a HTML submission form.

	A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request to a target destination without their knowledge or intent in order to perform an action as the victim. The underlying cause is application functionality using predictable URL /form actions in a repeatable way. The nature of the attack is that CSRF exploits the trust that a web site has for a user. By contrast, cross-site scripting (XSS) exploits the trust that a user has for a web site. Like XSS, CSRF attacks are not necessarily cross-site, but they can be. Cross-site request forgery is also known as CSRF, XSRF, one-click attack, session riding, confused deputy, and sea surf.
Description	CSRF attacks are effective in a number of situations, including:
	* The victim has an active session on the target site.
	* The victim is authenticated via HTTP auth on the target site.
	* The victim is on the same local network as the target site.
	CSRF has primarily been used to perform an action against a target site using the victim's privileges, but recent techniques have been discovered to disclose information by gaining access to the response. The risk of information disclosure is dramatically increased when the target site is vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operate within the bounds of the same-origin policy.

Method	POST
Attack	
Evidence	<form action="search.php?test=query" method="post"></form>
Other Info	No known Anti-CSRF token [anticsrf, CSRFToken,RequestVerificationToken, csrfmiddlewaretoken, authenticity_token, OWASP_CSRFTOKEN, anoncsrf, csrf_token, _csrf, _csrfSecret,csrf_magic, CSRF, _token, _csrf_token] was found in the following HTML form: [Form 1: "goButton" "searchFor" ].
URL	http://testphp.vulnweb.com/guestbook.php
Method	POST
Attack	
Evidence	<form action="" method="post" name="faddentry"></form>
Other Info	No known Anti-CSRF token [anticsrf, CSRFToken,RequestVerificationToken, csrfmiddlewaretoken, authenticity_token, OWASP_CSRFTOKEN, anoncsrf, csrf_token, _csrf, _csrfSecret,csrf_magic, CSRF, _token, _csrf_token] was found in the following HTML form: [Form 1: "name" "submit"].
URL	http://testphp.vulnweb.com/guestbook.php
Method	POST
Attack	
Evidence	<form action="search.php?test=query" method="post"></form>
Other Info	No known Anti-CSRF token [anticsrf, CSRFToken,RequestVerificationToken, csrfmiddlewaretoken, authenticity_token, OWASP_CSRFTOKEN, anoncsrf, csrf_token, _csrf, _csrfSecret,csrf_magic, CSRF, _token, _csrf_token] was found in the following HTML form: [Form 2: "goButton" "searchFor" ].
URL	http://testphp.vulnweb.com/search.php?test=query
Method	POST
Attack	
Evidence	<form action="search.php?test=query" method="post"></form>
Other Info	No known Anti-CSRF token [anticsrf, CSRFToken,RequestVerificationToken, csrfmiddlewaretoken, authenticity_token, OWASP_CSRFTOKEN, anoncsrf, csrf_token, _csrf, _csrfSecret,csrf_magic, CSRF, _token, _csrf_token] was found in the following HTML form: [Form 1: "goButton" "searchFor" ].

Instances	4
	Phase: Architecture and Design
	Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.
	For example, use anti-CSRF packages such as the OWASP CSRFGuard.
	Phase: Implementation
	Ensure that your application is free of cross-site scripting issues, because most CSRF defenses can be bypassed using attacker-controlled script.
	Phase: Architecture and Design
	Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upon receipt of the form. Be sure that the nonce is not predictable (CWE-330).
Solution	Note that this can be bypassed using XSS.
	Identify especially dangerous operations. When the user performs a dangerous operation, send a separate confirmation request to ensure that the user intended to perform that operation.
	Note that this can be bypassed using XSS.
	Use the ESAPI Session Management control.
	This control includes a component for CSRF.
	Do not use the GET method for any request that triggers a state change.
	Phase: Implementation
	Check the HTTP Referer header to see if the request originated from an expected page. This could break legitimate functionality, because users or proxies may have disabled sending the Referer for privacy reasons.

Medium	Content Security Policy (CSP) Header Not Set
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable

	Modern Web browsers support the Content-Security-Policy and X-Frame-Options HTTP headers. Ensure one of them is set on all web pages returned by your site/app.
Solution	If you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET) then you'll want to use SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY. Alternatively consider implementing Content Security Policy's "frame-ancestors" directive.

Instances	84
Solution	Ensure that your web server, application server, load balancer, etc. is configured to suppress the "Server" header or provide generic details.
Reference	https://httpd.apache.org/docs/current/mod/core.html#servertokens https://learn.microsoft.com/en-us/previous-versions/msp-n-p/ff648552(v=pandp.10) https://www.troyhunt.com/shhh-dont-let-your-response-headers/
CWE Id	200
WASC Id	13
Plugin Id	10036
Low	X-Content-Type-Options Header Missing
Description	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the declared content type. Current (early 2014) and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.
URL	http://testphp.vulnweb.com/AJAX/artists.php
Method	GET
Attack	
Evidence	
Other Info	This issue still applies to error type pages (401, 403, 500, etc.) as those pages are often still affected by injection issues, in which case there is still concern for browsers sniffing pages away from their actual content type. At "High" threshold this scan rule will not alert on client or server error responses.

Instances	75
Solution	Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages.  If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application /web server to not perform MIME-sniffing.

Informational	Authentication Request Identified
Description	The given request has been identified as an authentication request. The 'Other Info' field contains a set of key=value lines which identify any relevant fields. If the request is in a context which has an Authentication Method set to "Auto-Detect" then this rule will change the authentication to match the request identified.

Informational	Charset Mismatch (Header Versus Meta Content-Type Charset)
Description	This check identifies responses where the HTTP Content-Type header declares a charset different from the charset defined by the body of the HTML or XML. When there's a charset mismatch between the HTTP header and content body Web browsers can be forced into an undesirable content-sniffing mode to determine the content's correct character set.  An attacker could manipulate content on the page to be interpreted in an encoding of their choice. For example, if an attacker can control content at the beginning of the page, they could inject script using UTF-7 encoded text and manipulate some browsers into interpreting that text.

Informational	User Controllable HTML Element Attribute (Potential XSS)
Description	This check looks at user-supplied input in query string parameters and POST data to identify where certain HTML attribute values might be controlled. This provides hot-spot detection for XSS (cross-site scripting) that will require further review by a security analyst to determine exploitability.
URL	http://testphp.vulnweb.com/guestbook.php

Method

POST
